ENGINEERING)** Department of Computer Science and
Engineering

ASSESSMENT TOOL 3 – MCQs

Course Code:	CSA06	Course Title:	Design and Analysis of Algorithms
CO Assessed:	CO3: Articulation (BL4, BL5)	Assessment:	Assessment Tool 3 – MCQs
Weightage:	10% of CIA	Total Marks:	100
CO3 Statement:	Design Divide and Conquer algorithms for Merge Sort, Quick Sort, Binary Search and Matrix Multiplication		
Student Name:	J Venkata Varun	Reg. No.:	192372227
Section / Batch:	AI	Date:	26-08-26

Instructions to Students

- Answer all questions carefully. Each question carries 2 marks. Total: 100 marks.
- Analyze each question and select the correct answer.
- Apply concepts correctly to solve problem-based MCQs.
- Manage your time efficiently to complete all 50 questions.

Question Type	Focus Area	Questions
MCQs	Analyze and apply Divide and Conquer Algorithms for MergeSort, QuickSort, BinarySearch, and Matrix Multiplication.	Q1 -Q50

SECTION A – MCQs

Code of Conduct

I _____ (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: _____

RUBRICS FOR CALCULATION

Online Quiz / MCQ Test					
Criteria	Weightage (%)	Level 4 (Exemplary)	Level 3 (Proficient)	Level 2 (Developing)	Level 1 (Beginning)
Conceptual Understanding	30%	Demonstrates thorough understanding; answers all questions accurately	Shows good understanding with few errors	Partial understanding; several incorrect responses	Lacks understanding; majority of answers incorrect
Accuracy of Answers	25%	All answers are correct	Most answers are correct with minor mistakes	Some correct answers; frequent errors	Mostly incorrect answers
Application of Knowledge	20%	Correctly applies concepts to problem-based questions	Applies concepts with minor errors	Limited ability to apply concepts	Unable to apply concepts
Time Management	15%	Completes quiz well within time efficiently	Completes on time with minor delays	Requires extra time or rushes through questions	Unable to complete within given time
Question Interpretation	10%	Interprets all questions correctly and responds appropriately	Misinterprets a few questions	Often misinterprets questions	Unable to understand questions

Mark Evaluations:

Q1 Number of parts array divided in Merge Sort

2 marks

Merge Sort divides the input array into smaller parts before sorting and merging them. Into how many parts is the array divided at each step?

A. 3 parts

B. 2 parts

C. n parts

D. log n parts

 Save Answer

Next →

Q2 Reason Quick Sort is called in-place

2 marks

Quick Sort is considered an in-place algorithm because it minimizes additional memory usage. Why is it called in-place?

A. No recursion

B. Constant extra space

C. Uses merging

D. Uses DP

 Save Answer

Next →

Q3 Reason Merge Sort preferred for external sorting

2 marks

Merge Sort is often used in external sorting where data cannot fit into memory. Why is Merge Sort preferred?

- A. Faster pivot
- B. Stability and sequential access**
- C. Less recursion
- D. Less memory

 Save Answer

Next →

Q4 Merge Sort recurrence relation

2 marks

Merge Sort follows a divide-and-conquer strategy by splitting arrays and merging sorted halves. Identify the correct recurrence relation.

- A. $T(n) = 2T(n/2) + O(n)$**
- B. $T(n) = T(n-1) + O(1)$
- C. $T(n) = T(n/2) + O(1)$
- D. $T(n) = 2T(n/2) + O(1)$

 Save Answer

Next →

Q5 Condition where Binary Search fails

2 marks

Binary Search requires a specific condition to work correctly. When does Binary Search fail?

A. Small dataset

B. Unsorted data

C. Large dataset

D. Numeric data

 Save Answer

Next →

Q6 Strassen's algorithm multiplication reduction (2)

2 marks

Strassen's algorithm optimizes matrix multiplication by reducing the number of multiplication operations. How many multiplications are reduced compared to the standard method?

A. 6 to 5

B. 8 to 7

C. 9 to 7

D. 8 to 6

 Save Answer

Next →

Q7 Merge Sort auxiliary space complexity

2 marks

Merge Sort requires additional memory to merge sorted subarrays. Analyze its auxiliary space complexity.

A. $O(1)$

B. $O(\log n)$

C. $O(n)$

D. $O(n \log n)$

 Save Answer

Next →

Q8 Number of parts data divided in Binary Search

2 marks

Binary Search works by dividing the dataset into smaller portions. Into how many parts is the data divided?

A. Two halves

B. Three parts

C. Unequal parts

D. Random parts

 Save Answer

Next →

Q9 Operation minimized by Strassen's algorithm

2 marks

Strassen's algorithm achieves improved performance by reducing costly operations. Which operation is minimized?

A. Addition

B. Multiplication

C. Memory

D. Division

 Save Answer

Next →

Q10 Paradigm followed by Merge Sort

2 marks

Merge Sort is a recursive algorithm that divides the problem into smaller subproblems and solves them independently. Which paradigm does it follow?

A. Iterative

B. Divide and Conquer

C. Greedy

D. Dynamic Programming

 Save Answer

Next →

Q11 Merge Sort recursion tree height

2 marks

Merge Sort divides the array recursively until base cases are reached. Analyze the height of its recursion tree.

A. $\log n$

B. n

C. $n \log n$

D. n^2

 Save Answer

Next →

Q12 Merge Sort preferred over Quick Sort for linked lists

2 marks

Merge Sort is preferred over Quick Sort in certain scenarios such as linked lists. What is the primary reason?

A. Stability and sequential access

B. Faster pivot selection

C. Less recursion

D. Lower memory usage

 Save Answer

Next →

Q13 Binary Search complexity for unsuccessful search

2 marks

Binary Search may fail to find an element even after several comparisons. What is its complexity in an unsuccessful search?

A. $O(1)$

B. $O(\log n)$

C. $O(n)$

D. $O(n \log n)$

 Save Answer

Next →

Q14 Strassen's multiplication reduction

2 marks

Compared to the standard method, how many multiplications does Strassen's algorithm reduce?

A. 8 to 7

B. 7 to 6

C. 9 to 7

D. 8 to 6

 Save Answer

Next →

Q15 Property ensuring Merge Sort stability

2 marks

Merge Sort is considered stable because it preserves the relative order of elements. What property ensures this stability?

A. Preserves order during merging

B. Uses pivot selection

C. Uses recursion

D. Uses partitioning

 Save Answer

Next →

Q16 Quick Sort average time complexity

2 marks

Quick Sort average-case performance is efficient due to balanced partitions in most cases. What is its average time complexity?

A. $O(n^2)$

B. $O(n \log n)$

C. $O(\log n)$

D. $O(n)$

 Save Answer

Next →

Q17 Hybrid sort switching to Insertion Sort

2 marks

A common hybrid approach switches to Insertion Sort for small subarrays. Why is this optimization used?

- A. Reduce recursion depth
- B. Improve performance on small inputs**
- C. Avoid pivot selection
- D. Reduce space complexity

 Save Answer

Next →

Q18 Strassen's algorithm efficiency condition

2 marks

Strassen's algorithm performs better than naive multiplication only under certain conditions. When is it most efficient?

- A. Large input size**
- B. Small input size
- C. $n = 2$
- D. $n = 3$

 Save Answer

Next →

Q19 Strassen's algorithm reduced operation

2 marks

Strassen's algorithm is efficient because it reduces the number of a specific operation. Which operation is reduced compared to naive multiplication?

A. Additions

B. Multiplications

C. Memory usage

D. Recursion depth

 Save Answer

Next →

Q20 Binary Search mid index formula

2 marks

Binary Search computes the middle index during each step. Which formula is commonly used to find the mid value?

A. $(\text{low} + \text{high}) / 2$

B. $(\text{low} + \text{high}) / 3$

C. $(\text{low} + \text{high}) / 4$

D. $(\text{low} + \text{high}) / n$

 Save Answer

Next →

Q21 Name of Merge Sort's combining step

2 marks

Merge Sort combines sorted halves to produce a fully sorted array. What is this combining step called?

A. Partition

B. Merge

C. Divide

D. Swap

 Save Answer

Next →

Q22 Condition where Binary Search is most effective

2 marks

Binary Search is widely used for efficient searching in large datasets. When is Binary Search most effective?

A. Sorted data

B. Unsorted data

C. Large data

D. Duplicate data

 Save Answer

Next →

Q23 Reason Quick Sort is unstable

2 marks

Quick Sort is not a stable sorting algorithm due to its partitioning method. What is the main reason?

A. Pivot selection

B. In-place swaps

C. Recursion depth

D. Randomization

 Save Answer

Next →

Q24 Strassen's algorithm complexity

2 marks

Strassen's algorithm improves matrix multiplication by reducing the number of multiplications compared to the conventional method. What is its time complexity?

A. $O(n^2)$

B. $O(n^{2.81})$

C. $O(n \log n)$

D. $O(n^3)$

 Save Answer

Next →

Q25 Stable sorting algorithm

2 marks

Merge Sort and Quick Sort differ in stability when handling duplicate elements. Identify the stable algorithm.

A. Merge Sort

B. Quick Sort

C. Both

D. Neither

 Save Answer

Next →

Q26 Binary Search precondition

2 marks

Binary Search repeatedly divides the search space but works only under a specific condition. Identify the required condition.

A. Randomized data

B. Sorted data

C. Balanced data

D. Partitioned data

 Save Answer

Next →

Q27 Time complexity of partitioning in Quick Sort

2 marks

Quick Sort performs partitioning at each recursive step. What is the time complexity of the partition operation?

A. $O(1)$

B. $O(\log n)$

C. $O(n)$

D. $O(n^2)$

 Save Answer

Next →

Q28 Binary Search best-case complexity

2 marks

Binary Search efficiently finds an element by repeatedly dividing the search space. What is its best-case time complexity?

A. $O(n)$

B. $O(\log n)$

C. $O(1)$

D. $O(n \log n)$

 Save Answer

Next →

Q29 Element used for comparison in Binary Search

2 marks

Binary Search compares the target value with a specific element in the dataset at each step. Which element is used for comparison?

A. First element

B. Last element

C. Middle element

D. Random element

 Save Answer

Next →

Q30 Binary Search comparisons for $n=1000$

2 marks

For 1000 elements, determine the worst-case number of comparisons.

A. 9

B. 10

C. 11

D. 12

 Save Answer

Next →

Q31 Time complexity of recursive divide-and-conquer algorithm

2 marks

Consider a recurrence relation representing a divide-and-conquer algorithm with increasing recursive calls. Analyze how the complexity grows with input size. What is the time complexity?

A. $O(n \log n)$

B. $O(n^2)$

C. $O(n^{\log n})$

D. $O(\log n)$

 Save Answer

Next →

Q32 Main advantage of Quick Sort

2 marks

Quick Sort is often preferred in practical scenarios due to its in-place nature. What is the main advantage of Quick Sort?

A. Always faster

B. Uses less auxiliary space

C. Stable sorting

D. No recursion

 Save Answer

Next →

Q33 Reason Merge Sort is not in-place

2 marks

Merge Sort requires extra memory to store temporary arrays during merging. Why is it not in-place?

A. Uses recursion

B. Needs extra memory

C. Uses comparisons

D. Uses pivot

 Save Answer

Next →

Q34 Quick Sort on sorted array with first pivot

2 marks

If the input array is already sorted and the first element is chosen as pivot, what case is produced?

A. Best case

B. Worst case

C. Average case

D. None

 Save Answer

Next →

Q35 Binary Search recurrence relation

2 marks

Binary Search uses divide-and-conquer by halving the search space repeatedly. Identify its recurrence relation.

A. $T(n) = T(n/2) + O(1)$

B. $T(n) = T(n-1) + O(1)$

C. $T(n) = 2T(n/2) + O(n)$

D. $T(n) = T(n/2) + O(n)$

 Save Answer

Next →

Q36 Binary Search comparisons for n=1024

2 marks

For an array of size 1024, determine the maximum number of comparisons required in the worst case.

A. 9

B. 10

C. 11

D. 12

 Save Answer

Next →

Q37 Quick Sort worst-case pivot condition

2 marks

Quick Sort performance depends on how well the pivot divides the array. When does Quick Sort exhibit worst-case behavior?

- A. Pivot is median
- B. Pivot divides equally
- C. Pivot is smallest or largest
- D. Input is random

 Save Answer

Next →

Q38 Structure unsuitable for Binary Search

2 marks

Identify the data structure where Binary Search is not suitable to apply efficiently.

- A. Sorted arrays
- B. Linked lists
- C. Balanced trees
- D. Hash tables

 Save Answer

Next →

Q39 Merge Sort base case for recursion

2 marks

Merge Sort continues dividing the array until it reaches its smallest unit. When does this division stop?

A. Size becomes 2

B. Size becomes 1

C. Size becomes $n/2$

D. Array is sorted

 Save Answer

Next →

Q40 Worst-case comparisons in Binary Search

2 marks

Binary Search reduces the search space logarithmically with each comparison. What is the worst-case number of comparisons?

A. n

B. $\log n$

C. $n \log n$

D. n^2

 Save Answer

Next →

Q41 Divide and Conquer steps

2 marks

Identify the correct sequence of steps involved in the Divide and Conquer approach.

A. Break ? Solve ? Combine

B. Iterate ? Optimize ? Return

C. Choose ? Compare ? Select

D. Store ? Reuse ? Update

 Save Answer

Next →

Q42 Merge Sort time complexity in all cases

2 marks

Merge Sort maintains consistent performance regardless of input order. What is its time complexity in all cases?

A. $O(n^2)$

B. $O(n \log n)$

C. $O(\log n)$

D. $O(n)$

 Save Answer

Next →

Q43 Condition causing Quick Sort inefficiency

2 marks

Quick Sort performance depends heavily on pivot selection strategy. When does Quick Sort become inefficient?

- A. Random input
- B. Poor pivot selection**
- C. Small input
- D. Balanced partition

 Save Answer

Next →

Q44 Binary Search Tree traversal complexity

2 marks

Binary Search tree traversal visits all nodes sequentially. Analyze the time complexity of traversal operations.

- A. $O(n)$**
- B. $O(\log n)$
- C. $O(n \log n)$
- D. $O(n^2)$

 Save Answer

Next →

Q45 Average recursion depth of Quick Sort

2 marks

Quick Sort creates recursive calls based on partitioning of the array. What is the average recursion depth?

A. n

B. $\log n$

C. $n \log n$

D. 1

 Save Answer

Next →

Q46 Pivot position after partitioning

2 marks

Quick Sort uses a partitioning technique where a pivot element is selected and placed in its correct position. What happens to the pivot after partitioning?

A. Placed randomly

B. Moves to correct sorted position

C. Moves to first index

D. Moves to last index

 Save Answer

Next →

Q47 Quick Sort best performance condition

2 marks

Quick Sort achieves best performance when partitions are balanced. Under which condition does this occur?

A. Pivot divides array equally

B. Pivot is smallest

C. Pivot is largest

D. Pivot is random

 Save Answer

Next →

Q48 Type of arrays merged in Merge Sort

2 marks

Merge Sort combines smaller subarrays after dividing the original array recursively. What type of arrays are merged during this process?

A. Unsorted arrays

B. Sorted subarrays

C. Random elements

D. Single elements only

 Save Answer

Next →

Q49 Quick Sort worst case with poor pivot

2 marks

In Quick Sort, if the pivot selected is always the smallest element, what is the worst-case time complexity?

A. $O(n^2)$

B. $O(n \log n)$

C. $O(\log n)$

D. $O(n)$

 Save Answer

Next →

Q50 Technique used by Strassen's algorithm

2 marks

Strassen's algorithm applies a recursive strategy to multiply matrices efficiently. Which technique does it use?

A. Greedy

B. Divide and Conquer

C. Backtracking

D. Brute Force

 Save Answer
